

1. You are working on a new or enhanced system to help people at your college, university, or organization to find jobs. The system must be tailored to your student or work population and be very easy to use. Write a short paper describing how you would collect requirements for this system, and include at least five requirements in a requirements traceability matrix.

One way I would gather information for this system or website is by conducting interviews. This allows me to understand what students need and what future users might want. By doing this, I can create the system to meet the users' needs and ensure it will be used. It also helps me make sure that there is interest in the system so it won't be wasted. Another method I would use is surveys. Surveys help me find out what students are looking for and what types of jobs they are interested in. This information helps me design a system that works well for users. Like interviews, surveys will let me ask specific questions about the system to see which features should be included or left out, especially regarding job options. The information I would collect includes job preferences, preferred locations, salary expectations, skills, and communication preferences.

Requirements No.	Name	Description	Source	Status
R. 1	Job Listings	Employers can post jobs with a detailed description, requirements, and benefits.	Those offering the jobs.	In- Progress
R. 2	Application Process	System should let users apply through the site or the employers site.	Student Input (Stakeholders)	In- Progress
R. 3	Experience Level	Site will include questions about users' work experience and skills to match their job listings.	Student Input (Stakeholders)	In- Progress
R. 4	Review and Rating System	Students can review and rate places they've worked before	Student Input (Stakeholders)	In- Progress
R. 5	User Demographics	Site can take info on age, location and education level to tailor the website to the students.	Student Input (Stakeholders)	In- Progress
