1. Write a 1 page paper on what makes a good project resource plan? What components are needed for your project? Briefly describe the components you think make up a good plan.

Considering what I read, a good project resource management includes the following processes: Planning Resource Management, Estimating Activity Resources, Acquiring Resources, Developing the Project Team, Managing the Project Team, and Controlling Resources. The components needed for our project are project documents like the Charter, Scope, WBS, and RACI etc. Other resources include certain software, a good team, testing and other app implementations for our app.

- Planning resource management- We can do this by creating project documents like we did in the start for like Charter document, Scope document and now the RACI all these help organize and create a structure for your project.

- Estimating Activity Resources- Through this step we can start creating a WBS. It helps us track each task and activity as it needs to get done through certain dates. We can also implement this step by making changes to the previous document like the project document.

- Acquiring Resources- This includes creating the actual team and well as the requirements for the project like the manager, team members, supplies, and other resources. Through this we can get change requests and assign team members their part in the project helping us create resource calendars.

- Developing the project team- This step I think builds upon the previous one by team building through certain skills. A good team in my opinion creates a good project, Through this we can create team performance assessments.

- Managing the Project Team- This step also builds on the previous one by managing the team and providing feedback as well as resolving certain issues that may come up. This all can better the team performance. This can lead to good project management plan updates as stated in the textbook.

- Controlling resources- By monitoring the planned resources we can control how many resources are being used so we have a set budget helping us see how many resources are available and if we need to get more of a certain resource. This step can lead to change requests as resources are something that can be added or removed.
